Tasks Details

1. FrogJmp

Easy

Count minimal number of jumps from position X to Y.

Task Score	Correctness	Performance
100%	100%	100%

Task description

A small frog wants to get to the other side of the road. The frog is currently located at position X and wants to get to a position greater than or equal to Y. The small frog always jumps a fixed distance, D.

Count the minimal number of jumps that the small frog must perform to reach its target.

Write a function:

```
int solution(int X, int Y, int D);
```

that, given three integers X, Y and D, returns the minimal number of jumps from position X to a position equal to or greater than Y.

For example, given:

```
X = 10
Y = 85
D = 30
```

the function should return 3, because the frog will be positioned as follows:

- after the first jump, at position 10 + 30 = 40
- after the second jump, at position 10 + 30 + 30 = 70

Solution

Programming language used:	C++
Total time used:	3 minutes
Effective time used:	3 minutes
Notes:	*not defined yet*

Task timeline

12:48:20 12:51:18

Code: 12:51:18 UTC, cpp, final, score: **100** show code in pop-up

```
1  // you can use includes, for example:
2  // #include <algorithm>
3
```

- after the third jump, at position 10 + 30 + 30 + 30 = 100

Write an **efficient** algorithm for the following assumptions:

- X, Y and D are integers within the range [1..1,000,000,000];
- X ≤ Y.

```
4  // you can write to stdout for debugging purpo
5  // cout << "this is a debug message" << endl;
6
7  int solution(int X, int Y, int D) {
8      if (X == Y) {
9          return 0;
10     }
11
12     int dis = Y - X;
13     int answer = dis / D;
14
15     if (dis % D > 0) {
16         answer++;
17     }
18
19     return answer;
20 }
```

Analysis summary

The solution obtained perfect score.

Analysis

Detected time complexity: **O(1)**
